

About the QIK Test

- Provides objective measurement of brain performance
- Measures how fast, accurate and consistent one is
- Results influenced by brain dysregulations (symptoms)
- Allows tracking changes in performance to go along with changes in symptoms
- Can be repeated every 20 sessions, or whenever more information about progress is needed

- QIK test is not a diagnostic tool
- It does not help with designing the training protocol
- It does not influence the clinical decisions

But!

- It provides objective data about performance
- It helps track progress
- Sometimes it's the only way we can track progress, when there is little or no client reporting on changes in symptoms
